

# Package: gtxr (via r-universe)

September 23, 2024

**Title** Query the GTEx Portal API

**Version** 0.1.0.9000

**Description** A convenient R interface to the Genotype-Tissue Expression (GTEx) Portal API. For more information on the API, see <<https://gtexportal.org/api/v2/redoc>>.

**License** MIT + file LICENSE

**URL** <https://rmgpanw.github.io/gtxr/>, <https://github.com/rmgpanw/gtxr>

**BugReports** <https://github.com/rmgpanw/gtxr/issues>

**Encoding** UTF-8

**Roxygen** list(markdown = TRUE)

**RoxygenNote** 7.3.1

**Imports** cli, dplyr, httr2 (>= 1.0.0), purrr, rlang, tibble, tidyverse

**Suggests** curl, htptest2, knitr, rmarkdown, testthat (>= 3.0.0)

**Config/testthat/edition** 3

**VignetteBuilder** knitr

**Repository** <https://rmgpanw.r-universe.dev>

**RemoteUrl** <https://github.com/rmgpanw/gtxr>

**RemoteRef** HEAD

**RemoteSha** 44fdac59118e94209bc7ce3735e57941a1ef087a

Calculate Expression Quantitative Trait Loci
```

---

## Description

Calculate your own eQTLs

- This service calculates the gene-variant association for any given pair of gene and variant, which may or may not be significant.
- This requires as input a GENCODE ID, GTEx variant ID, and tissue site detail ID.

By default, the calculation is based on the latest GTEx release.

[GTEx Portal API documentation](#).

## Usage

```
calculate_expression_quantitative_trait_loci(
    tissueSiteDetailId,
    gencodeId,
    variantId,
    datasetId = "gtex_v8"
)
```

## Arguments

tissueSiteDetailId	String. The ID of the tissue of interest. Can be a GTEx specific ID (e.g. "Whole_Blood"; use <a href="#">get_tissue_site_detail()</a> to see valid values) or an Ontology ID.
gencodeId	String. A Versioned GENCODE ID of a gene, e.g. "ENSG00000065613.9".
variantId	String. A gtex variant ID.
datasetId	String. Unique identifier of a dataset. Usually includes a data source and data release. Options: "gtex_v8", "gtex_snrnaseq_pilot".

## Details

Notes on output:

- Beta and standard error are recorded in columns nes and error respectively (see [GTEx FAQs](#))
- variantId contains (in order) chromosome, position, reference allele, alternative allele and human genome build separated by underscores. The reference and alternative alleles for "chr1\_13550\_G\_A\_b38" for example are "G" and "A" respectively.
- See examples for how to calculate minor and alternative allele frequencies.

Notes on input:

- Argument variantId also accepts RSIDs.

**Value**

A tibble.

**See Also**

## End(Not run)

```

## calculate\_ieqtls      *Calculate Ieqtls*

### Description

Calculate your own Cell Specific eQTLs.

- This service calculates the gene-variant association for any given pair of gene and variant, which may or may not be significant.
- This requires as input a GENCODE ID, GTEx variant ID, and tissue site detail ID.

By default, the calculation is based on the latest GTEx release.

[GTEx Portal API documentation](#).

### Usage

```

calculate_ieqtls(
  cellType,
  tissueSiteDetailId,
  gencodeId,
  variantId,
  datasetId = "gtex_v8"
)

```

### Arguments

cellType	String. "Adipocytes", "Epithelial_cells", "Hepatocytes", "Keratinocytes", "Myocytes", "Neurons", "Neutrophils".
tissueSiteDetailId	String. The ID of the tissue of interest. Can be a GTEx specific ID (e.g. "Whole_Blood"; use <a href="#">get_tissue_site_detail()</a> to see valid values) or an Ontology ID.
gencodeId	String. A Versioned GENCODE ID of a gene, e.g. "ENSG00000065613.9".
variantId	String. A gtex variant ID.
datasetId	String. Unique identifier of a dataset. Usually includes a data source and data release. Options: "gtex_v8", "gtex_snrnaseq_pilot".

**Value**

A tibble.

**See Also**

Other Dynamic Association Endpoints: [calculate\\_expression\\_quantitative\\_trait\\_loci\(\)](#), [calculate\\_isqtl\(\)](#), [calculate\\_splicing\\_quantitative\\_trait\\_loci\(\)](#)

**Examples**

```
## Not run:
# perform request
calculate_ieqtl(
  cellType = "Adipocytes",
  tissueSiteDetailId = "Adipose_Subcutaneous",
  gencodeId = "ENSG00000203782.5",
  variantId = "chr1_1099341_T_C_b38")

## End(Not run)
```

**calculate\_isqtl**      *Calculate Isqtl*

**Description**

Calculate your own Cell Specific sQTLs.

- This service calculates the gene-variant association for any given pair of gene and variant, which may or may not be significant.
- This requires as input a GENCODE ID, GTEx variant ID, and tissue site detail ID.

By default, the calculation is based on the latest GTEx release.

[GTEx Portal API documentation](#).

**Usage**

```
calculate_isqtl(
  cellType,
  tissueSiteDetailId,
  phenotypeId,
  variantId,
  datasetId = "gtex_v8"
)
```

## Arguments

cellType String. "Adipocytes", "Epithelial\_cells", "Hepatocytes", "Keratinocytes", "Myocytes", "Neurons", "Neutrophils".

tissueSiteDetailId String. The ID of the tissue of interest. Can be a GTEx specific ID (e.g. "Whole\_Blood"; use [get\\_tissue\\_site\\_detail\(\)](#) to see valid values) or an Ontology ID.

phenotypeId String. See [GTEx portal FAQs](#) for further details.

variantId String. A gtex variant ID.

datasetId String. Unique identifier of a dataset. Usually includes a data source and data release. Options: "gtex\_v8", "gtex\_snrnaseq\_pilot".

## Value

A tibble.

## See Also

Other Dynamic Association Endpoints: [calculate\\_expression\\_quantitative\\_trait\\_loci\(\)](#), [calculate\\_ieqtls\(\)](#), [calculate\\_splicing\\_quantitative\\_trait\\_loci\(\)](#)

## Examples

```
## Not run:
# perform request
calculate_isqtls(cellType = "Neutrophils",
                  tissueSiteDetailId = "Whole_Blood",
                  phenotypeId = "chr1:15947:16607:clu_40980:ENSG00000227232.5",
                  variantId = "chr1_1099341_T_C_b38")

## End(Not run)
```

**calculate\_splicing\_quantitative\_trait\_loci**  
*Calculate Splicing Quantitative Trait Loci*

## Description

[GTEx Portal API documentation](#).

## Usage

```
calculate_splicing_quantitative_trait_loci(
  tissueSiteDetailId,
  phenotypeId,
  variantId,
  datasetId = "gtex_v8"
)
```

## Arguments

<code>tissueSiteDetailId</code>	String. The ID of the tissue of interest. Can be a GTEx specific ID (e.g. "Whole_Blood"; use <a href="#">get_tissue_site_detail()</a> to see valid values) or an Ontology ID.
<code>phenotypeId</code>	String. See <a href="#">GTEx portal FAQs</a> for further details.
<code>variantId</code>	String. A gtex variant ID.
<code>datasetId</code>	String. Unique identifier of a dataset. Usually includes a data source and data release. Options: "gtex_v8", "gtex_snrnaseq_pilot".

## Value

A tibble.

## See Also

[download](#)

*Download*

## Description

[GTEx Portal API documentation](#)

## Usage

```
download(
  materialTypes = NULL,
  tissueSiteDetailIds = NULL,
  pathCategory = NULL,
  tissueSampleIds = NULL,
  sex = NULL,
  sortBy = NULL,
  sortDirection = NULL,
```

```

searchTerm = NULL,
sampleIds = NULL,
subjectIds = NULL,
ageBrackets = NULL,
hardyScales = NULL,
hasExpressionData = NULL,
hasGenotype = NULL
)

```

## Arguments

<b>materialTypes</b>	String, vector. Options: "Cells:Cell Line Viable", "DNA:DNA Genomic", "DNA:DNA Somatic", "RNA:Total RNA", "Tissue:PAXgene Preserved", "Tissue:PAXgene Preserved Paraffin-embedded", "Tissue:Fresh Frozen Tissue".
<b>tissueSiteDetailIds</b>	Character vector of IDs for tissues of interest. Can be GTEx specific IDs (e.g. "Whole_Blood"; use <a href="#">get_tissue_site_detail()</a> to see valid values) or Ontology IDs.
<b>pathCategory</b>	Character vector. Options: "adenoma", "amylacea", "atelectasis", "atherosclerosis", "atherosis", "atrophy", "calcification", "cirrhosis", "clean_specimens", "congestion", "corpora_albicania", "cyst", "desquamation", "diabetic", "dysplasia", "edema", "emphysema", "esophagitis", "fibrosis", "gastritis", "glomerulosclerosis", "goiter", "gynecomastoid", "hashimoto", "heart_failure_cells", "hemorrhage", "hepatitis", "hyalinization", "hypereosinophilia", "hyperplasia", "hypertrophy", "hypoxic", "infarction", "inflammation", "ischemic_changes", "macrophages", "mastopathy", "metaplasia", "monckeberg", "necrosis", "nephritis", "nephrosclerosis", "no_abnormalities", "nodularity", "pancreatitis", "pigment", "pneumonia", "post_menopausal", "prostatitis", "saponification", "scarring", "sclerotic", "solar_elastosis", "spermatogenesis", "steatosis", "sweat_glands", "tma".
<b>tissueSampleIds</b>	Array of strings. A list of Tissue Sample ID(s).
<b>sex</b>	String. Options: "male", "female".
<b>sortBy</b>	String. Options: "sampleId", "ischemicTime", "aliquotId", "tissueSampleId", "hardyScale", "pathologyNotes", "ageBracket", "tissueSiteDetailId", "sex".
<b>sortDirection</b>	String. Options: "asc", "desc". Default = "asc".
<b>searchTerm</b>	String.
<b>sampleIds</b>	Character vector. GTEx sample ID.
<b>subjectIds</b>	Character vector. GTEx subject ID.
<b>ageBrackets</b>	The age bracket(s) of the donors of interest. Options: "20-29", "30-39", "40-49", "50-59", "60-69", "70-79".
<b>hardyScales</b>	Character vector. A list of Hardy Scale(s) of interest. Options: "Ventilator case", "Fast death - violent", "Fast death - natural causes", "Intermediate death", "Slow death".
<b>hasExpressionData</b>	Logical.
<b>hasGenotype</b>	Logical.

## Details

Note: running this request with no filters (i.e. `download()`) raises an error.

## Value

A tibble

## See Also

Other Biobank Data Endpoints: [get\\_sample\\_biobank\\_data\(\)](#)

## Examples

```
## Not run:
download(
  materialTypes = "RNA:Total RNA",
  tissueSiteDetailIds = "Thyroid",
  pathCategory = "clean_specimens",
  sex = "male",
  ageBrackets = "50-59"
)
## End(Not run)
```

`get_annotation`      *Get Annotation*

## Description

This service returns the list of annotations and allowed values by which a particular dataset can be subsetted. Results may be filtered by dataset.

[GTEx Portal API documentation](#)

## Usage

```
get_annotation(datasetId = "gtex_v8", page = 0, itemsPerPage = 250)
```

## Arguments

<code>datasetId</code>	String. Unique identifier of a dataset. Usually includes a data source and data release. Options: "gtex_v8", "gtex_snrnaseq_pilot".
<code>page</code>	Integer (default = 0).
<code>itemsPerPage</code>	Integer (default = 250).

## Details

Note: the output for this function appears to be incomplete currently.

---

get\_clustered\_median\_exon\_expression  
*Get Clustered Median Exon Expression*

---

**Description**

Find median transcript expression data along with hierarchical clusters.

- Returns median normalized transcript expression in tissues of all known transcripts of a given gene along with the hierarchical clustering results of tissues and transcripts, based on exon expression, in Newick format.
- The hierarchical clustering is performed by calculating Euclidean distances and using the average linkage method.
- **This endpoint is not paginated.**

By default, this endpoint queries the latest GTEx release.

[GTEx Portal API documentation](#)

**Usage**

```
get_clustered_median_exon_expression(  
  gencodeIds,  
  datasetId = "gtex_v8",  
  tissueSiteDetailIds = NULL  
)
```

## Arguments

<code>gencodeIds</code>	A character vector of Versioned GENCODE IDs, e.g. c("ENSG00000132693.12", "ENSG00000203782.5").
<code>datasetId</code>	String. Unique identifier of a dataset. Usually includes a data source and data release. Options: "gtex_v8", "gtex_snrnaseq_pilot".
<code>tissueSiteDetailIds</code>	Character vector of IDs for tissues of interest. Can be GTEx specific IDs (e.g. "Whole_Blood"; use <code>get_tissue_site_detail()</code> to see valid values) or Ontology IDs.

## Value

A tibble, with clustering data stored as an attribute, "clusters".

result <- get_clustered_median_junction_expression(c("ENSG00000203782.5",
                                                       "ENSG00000132693.12"))
attr(result, "clusters")

# process clustering data with the ape package
# install.packages("ape")
# phylo_tree <- ape:::read.tree(text = attr(result, "clusters")$tissue)
# plot(phylo_tree)
# print(phylo_tree)

## End(Not run)
```

## Description

Find median transcript expression data of all known transcripts of a gene along with hierarchical clusters.

- Returns median normalized expression in tissues of all known transcripts of a given gene along with the hierarchical clustering results of tissues and genes, based on expression, in Newick format.
- Results may be filtered by dataset, gene or tissue, but at least one gene must be provided.
- The hierarchical clustering is performed by calculating Euclidean distances and using the average linkage method.
- **This endpoint is not paginated.**

By default, this service queries the latest GTEx release.

[GTEx Portal API documentation](#)

## Usage

```
get_clustered_median_transcript_expression(
  gencodeIds,
  datasetId = "gtex_v8",
  tissueSiteDetailIds = NULL
)
```

## Arguments

<code>gencodeIds</code>	A character vector of Versioned GENCODE IDs, e.g. <code>c("ENSG00000132693.12", "ENSG00000203782.5")</code> .
<code>datasetId</code>	String. Unique identifier of a dataset. Usually includes a data source and data release. Options: <code>"gtex_v8"</code> , <code>"gtex_snrnaseq_pilot"</code> .
<code>tissueSiteDetailIds</code>	Character vector of IDs for tissues of interest. Can be GTEx specific IDs (e.g. <code>"Whole_Blood"</code> ; use <a href="#">get_tissue_site_detail()</a> to see valid values) or Ontology IDs.

## Value

A tibble, with clustering data stored as an attribute, `"clusters"`.

## See Also

## Not run:
get_clustered_median_transcript_expression(gencodeIds = c("ENSG00000203782.5",
                                         "ENSG00000132693.12"))

# clustering data is stored as an attribute "clusters"
result <- get_clustered_median_transcript_expression(c("ENSG00000203782.5",
                                         "ENSG00000132693.12"))
attr(result, "clusters")

# process clustering data with the ape package
# install.packages("ape")
# phylo_tree <- ape::read.tree(text = attr(result, "clusters")$tissue)
# plot(phylo_tree)
# print(phylo_tree)

## End(Not run)

```

**getCollapsedGeneModelExon**  
*Get Collapsed Gene Model Exon*

## Description

This service returns the collapsed exons in the gene model of the given gene. Gene-level and exon-level expression quantification were based on the GENCODE annotation, collapsed to a single transcript model for each gene using an algorithm developed by the GTEx analysis team.

By default, this service queries the models used by the latest GTEx release.

[GTEx Portal API documentation](#)

## Usage

```
getCollapsedGeneModelExon(
  gencodeId,
  datasetId = "gtex_v8",
  page = 0,
  itemsPerPage = 250
)
```

## Arguments

gencodeId	String. A Versioned GENCODE ID of a gene, e.g. "ENSG00000065613.9".
datasetId	String. Unique identifier of a dataset. Usually includes a data source and data release. Options: "gtex_v8", "gtex_snrnaseq_pilot".
page	Integer (default = 0).
itemsPerPage	Integer (default = 250).

**Value**

A tibble

**See Also**

Other Datasets Endpoints: `get_annotation()`, `get_downloads_page_data()`, `get_file_list()`, `get_full_get_collapsed_gene_model_exon()`, `get_functional_annotation()`, `get_linkage_disequilibrium_by_allele()`, `get_linkage_disequilibrium_data()`, `get_sample_datasets_endpoints()`, `get_subject()`, `get_tissue_site_detail()`, `get_variant()`, `get_variant_by_location()`

**Examples**

```
## Not run:
getCollapsedGeneModelExon(gencodeId = "ENSG00000132693.12")

## End(Not run)
```

`get_dataset_info`      *Get Dataset Info*

**Description**

[GTEx Portal API documentation](#)

**Usage**

```
get_dataset_info(datasetId = "gtex_v8", organizationName = "GTEx Consortium")
```

**Arguments**

<code>datasetId</code>	String. Unique identifier of a dataset. Usually includes a data source and data release. Options: "gtex_v8", "gtex_snrnaseq_pilot".
<code>organizationName</code>	String. Options: "GTEx Consortium" "Kid's First".

**Details**

Note: this current only returns empty values.

**Value**

A tibble.

**Examples**

```
## Not run:
get_dataset_info()

## End(Not run)
```

---

get\_downloads\_page\_data  
*Get Downloads Page Data*

---

## Description

Retrieves all the files belonging to the given project\_id for display on the Downloads Page  
[GTEx Portal API documentation](#)

## Usage

```
get_downloads_page_data(project_id = "adult-gtex")
```

## Arguments

project\_id      String. Options: "gtex", "adult-gtex", "egtex".

## Details

Note: The GTEx Portal API documentation states "GTEx currently has one project available: gtex". However, project\_id values "adult-gtex" and "egtex" both return results, whereas "gtex" does not (see examples).

## Value

A Tibble

)

## End(Not run)

```

**get\_eqtl\_genes**      *Get Eqtl Genes*

### Description

Retrieve eGenes (eQTL Genes).

- This service returns eGenes (eQTL Genes) from the specified dataset.
- eGenes are genes that have at least one significant cis-eQTL acting upon them.
- Results may be filtered by tissue. By default, the service queries the latest GTEx release.

For each eGene, the results include the allelic fold change (log2AllelicFoldChange), p-value (pValue), p-value threshold (pValueThreshold), empirical p-value (empiricalPValue), and q-value (qValue).

- The log2AllelicFoldChange is the allelic fold change (in log2 scale) of the most significant eQTL.
- The pValue is the nominal p-value of the most significant eQTL.
- The pValueThreshold is the p-value threshold used to determine whether a cis-eQTL for this gene is significant. For more details see <https://gtexportal.org/home/documentationPage#staticTextAnalysisMethods>.
- The empiricalPValue is the beta distribution-adjusted empirical p-value from FastQTL.
- The qValues were calculated based on the empirical p-values. A false discovery rate (FDR) threshold of <= 0.05 was applied to identify genes with a significant eQTL.

[GTEx Portal API documentation](#).

### Usage

```

get_eqtl_genes(
  tissueSiteDetailIds,
  datasetId = "gtex_v8",
  page = 0,
  itemsPerPage = 250
)

```

## Arguments

tissueSiteDetailIds	Character vector of IDs for tissues of interest. Can be GTEx specific IDs (e.g. "Whole_Blood"; use <a href="#">get_tissue_site_detail()</a> to see valid values) or Ontology IDs.
datasetId	String. Unique identifier of a dataset. Usually includes a data source and data release. Options: "gtex_v8", "gtex_snrnaseq_pilot".
page	Integer (default = 0).
itemsPerPage	Integer (default = 250).

## Value

A tibble.

## See Also

get_eqtl_genes(c("Whole_Blood", "Artery_Aorta"))  
  
## End(Not run)
```

---

get\_exons

*Get Exons*

---

## Description

This service returns exons from all known transcripts of the given gene.

- A versioned GENCODE ID is required to ensure that all exons are from a single gene.
- A dataset ID or both GENCODE version and genome build must be provided.
- Although annotated exons are not dataset dependent, specifying a dataset here is equivalent to specifying the GENCODE version and genome build used by that dataset.

**Usage**

```
get_exons(
  gencodeId,
  gencodeVersion = NULL,
  genomeBuild = NULL,
  datasetId = "gtex_v8",
  page = 0,
  itemsPerPage = 250
)
```

**Arguments**

gencodeId	String. A Versioned GENCODE ID of a gene, e.g. "ENSG00000065613.9".
gencodeVersion	String (default = "v26"). GENCODE annotation release. Either "v26" or "v19".
genomeBuild	String. Options: "GRCh38/hg38", "GRCh37/hg19". Default = "GRCh38/hg38".
datasetId	String. Unique identifier of a dataset. Usually includes a data source and data release. Options: "gtex_v8", "gtex_snrnaseq_pilot".
page	Integer (default = 0).
itemsPerPage	Integer (default = 250).

**Value**

A tibble.

## End(Not run)
```

*get\_expression\_pca      Get Expression Pca*

**Description**

Find gene expression PCA data.

- Returns gene expression PCA (principal component analysis) in tissues.
- Results may be filtered by tissue, sample, or dataset.

By default, the service queries the latest GTEx release.

[GTEx Portal API documentation](#)

**Usage**

```
get_expression_pca(
  tissueSiteDetailIds,
  datasetId = "gtex_v8",
  sampleId = NULL,
  page = 0,
  itemsPerPage = 250
)
```

**Arguments**

tissueSiteDetailIds	Character vector of IDs for tissues of interest. Can be GTEx specific IDs (e.g. "Whole_Blood"; use <a href="#">get_tissue_site_detail()</a> to see valid values) or Ontology IDs.
datasetId	String. Unique identifier of a dataset. Usually includes a data source and data release. Options: "gtex_v8", "gtex_snRNAseq_pilot".
sampleId	String. ^GTEX-[A-Z0-9]{5}-[0-9]{4}-SM-[A-Z0-9]{5}\$
page	Integer (default = 0).
itemsPerPage	Integer (default = 250).

**Value**

A tibble.

**See Also**

                                             "Whole_Blood"))

get_expression_pca(tissueSiteDetailIds = "Adipose_Subcutaneous",
                  sampleId = "GTEX-1117F-0226-SM-5GZZ7")

## End(Not run)
```

---

<code>get_file_list</code>	<i>Get File List</i>
----------------------------	----------------------

---

## Description

Get all the files in GTEx dataset for Download page

[GTEx Portal API documentation](#)

## Usage

```
get_file_list()
```

## Details

The returned tibble includes a nested list column, "filesets". This details files, sub-categorised by fileset (see examples section).

## Value

A tibble

## See Also

Other Datasets Endpoints: [get\\_annotation\(\)](#), [get\\_collapsed\\_gene\\_model\\_exon\(\)](#), [get\\_downloads\\_page\\_data\(\)](#), [get\\_full\\_get\\_collapsed\\_gene\\_model\\_exon\(\)](#), [get\\_functional\\_annotation\(\)](#), [get\\_linkage\\_disequilibrium\\_by\\_location\(\)](#), [get\\_linkage\\_disequilibrium\\_data\(\)](#), [get\\_sample\\_datasets\\_endpoints\(\)](#), [get\\_subject\(\)](#), [get\\_tissue\\_site\\_detail\(\)](#), [get\\_variant\(\)](#), [get\\_variant\\_by\\_location\(\)](#)

## Examples

# "GTEx Analysis V9", "snRNA-Seq Data" fileset files
names(gtex_v9_files[[1]][["snRNA-Seq Data"]])$files

## End(Not run)
```

---

get\_fine\_mapping      *Get Fine Mapping*

---

## Description

Retrieve Fine Mapping Data

- Finds and returns Fine Mapping data for the provided list of genes
- By default, this endpoint fetches data from the latest GTEx version

The retrieved data is split into pages with items\_per\_page entries per page

[GTEx Portal API documentation](#)

## Usage

```
get_fine_mapping(  
  gencodeIds,  
  datasetId = "gtex_v8",  
  variantId = NULL,  
  tissueSiteDetailIds = NULL,  
  page = 0,  
  itemsPerPage = 250  
)
```

## Arguments

gencodeIds	A character vector of Versioned GENCODE IDs, e.g. c("ENSG00000132693.12", "ENSG00000203782.5").
datasetId	String. Unique identifier of a dataset. Usually includes a data source and data release. Options: "gtex_v8", "gtex_snrnaseq_pilot".
variantId	String. A gtex variant ID.
tissueSiteDetailIds	Character vector of IDs for tissues of interest. Can be GTEx specific IDs (e.g. "Whole_Blood"; use <a href="#">get_tissue_site_detail()</a> to see valid values) or Ontology IDs.
page	Integer (default = 0).
itemsPerPage	Integer (default = 250).

## Value

A tibble.

```

`get_genes`*Get Genes*

## Description

This service returns information about reference genes. A genome build and GENCODE version must be provided.

- Genes are searchable by gene symbol, GENCODE ID and versioned GENCODE ID.
- Versioned GENCODE ID is recommended to ensure unique ID matching.
- By default, this service queries the genome build and GENCODE version used by the latest GTEx release.

[GTEx API Portal documentation](#)

## Usage

```
get_genes(
  geneIds,
  gencodeVersion = "v26",
  genomeBuild = "GRCh38/hg38",
  page = 0,
  itemsPerPage = 250
)
```

## Arguments

<code>geneIds</code>	A character vector of gene symbols, versioned gencodeIds, or unversioned gencodeIds.
<code>gencodeVersion</code>	String (default = "v26"). GENCODE annotation release. Either "v26" or "v19".
<code>genomeBuild</code>	String. Options: "GRCh38/hg38", "GRCh37/hg19". Default = "GRCh38/hg38".
<code>page</code>	Integer (default = 0).
<code>itemsPerPage</code>	Integer (default = 250).

---

**get\_gene\_expression     *Get Gene Expression***

---

**Description**

Find normalized gene expression data.

- Returns normalized gene expression in tissues at the sample level.
- Results may be filtered by dataset, gene or tissue, but at least one gene must be provided.

By default, this service queries the latest GTEx release.

[GTEx Portal API documentation](#)

**Usage**

```
get_gene_expression(  
  gencodeIds,  
  datasetId = "gtex_v8",  
  tissueSiteDetailIds = NULL,  
  attributeSubset = NULL,  
  page = 0,  
  itemsPerPage = 250  
)
```

**Arguments**

gencodeIds	A character vector of Versioned GENCODE IDs, e.g. c("ENSG00000132693.12", "ENSG00000203782.5").
datasetId	String. Unique identifier of a dataset. Usually includes a data source and data release. Options: "gtex_v8", "gtex_snrnaseq_pilot".

**tissueSiteDetailIds**  
 Character vector of IDs for tissues of interest. Can be GTEx specific IDs (e.g. "Whole\_Blood"; use `get_tissue_site_detail()` to see valid values) or Ontology IDs.

**attributeSubset**  
 String. Examples include but are not limited to "sex", "ageBracket"

**page**  
 Integer (default = 0).

**itemsPerPage**  
 Integer (default = 250).

## Value

A tibble.

## See Also

                    attributeSubset = "ageBracket")

## End(Not run)
```

---

get_gene_search	<i>Get Gene Search</i>
-----------------	------------------------

---

## Description

Find genes that are partial or complete match of a gene\_id

- gene\_id could be a gene symbol, a gencode ID, or an Ensemble ID
- Gencode Version and Genome Build must be specified

[GTEx Portal API documentation](#)

## Usage

```
get_gene_search(  
  geneId,  
  gencodeVersion = "v26",  
  genomeBuild = "GRCh38/hg38",  
  page = 0,  
  itemsPerPage = 250  
)
```

## Arguments

geneId	String. A gene symbol, a gencode ID, or an Ensemble ID.
gencodeVersion	String (default = "v26"). GENCODE annotation release. Either "v26" or "v19".
genomeBuild	String. Options: "GRCh38/hg38", "GRCh37/hg19". Default = "GRCh38/hg38".
page	Integer (default = 0).
itemsPerPage	Integer (default = 250).

## Value

A tibble.

`get_genomic_features` *Get Genomic Features*

## Description

[GTEx API Portal documentation](#)

## Usage

```
get_genomic_features(.featureId, datasetId = "gtex_v8")
```

## Arguments

- .featureId      String. A genomic feature e.g. GENCODE ID, RSID or GTEx Variant ID.
- datasetId      String. Unique identifier of a dataset. Usually includes a data source and data release. Options: "gtex\_v8", "gtex\_srnaseq\_pilot".

## Details

This endpoint takes a path parameter "featureId".

## Value

A tibble.

## See Also

# gene symbol
get_genomic_features("brca1")

# GENCODE ID
get_genomic_features("ENSG00000132693.12")

# RSID
get_genomic_features("rs1815739")

# GTEx variant ID
get_genomic_features("chr11_66561023_G_GTTA_b38")

## End(Not run)
```

---

get\_gwas\_catalog\_by\_location  
*Get Gwas Catalog By Location*

---

## Description

Find the GWAS Catalog on a certain chromosome between start and end locations.

[GTEx API Portal documentation](#)

## Usage

```
get_gwas_catalog_by_location(  
  start,  
  end,  
  chromosome,  
  page = 0,  
  itemsPerPage = 250  
)
```

## Arguments

start	Integer.
end	Integer.
chromosome	String. One of "chr1", "chr2", "chr3", "chr4", "chr5", "chr6", "chr7", "chr8", "chr9", "chr10", "chr11", "chr12", "chr13", "chr14", "chr15", "chr16", "chr17", "chr18", "chr19", "chr20", "chr21", "chr22", "chrM", "chrX", "chrY".
page	Integer (default = 0).
itemsPerPage	Integer (default = 250).

## Value

A tibble.

## End(Not run)
```

`get_image`*Get Image***Description**[GTEx Portal API documentation](#)**Usage**

```
get_image(tissueSampleIds = NULL, page = 0, itemsPerPage = 250)
```

**Arguments**

<code>tissueSampleIds</code>	Array of strings. A list of Tissue Sample ID(s).
<code>page</code>	Integer (default = 0).
<code>itemsPerPage</code>	Integer (default = 250).

**Value**

A tibble.

**Examples**

```
## Not run:
get_image()

# filter by `tissueSampleId`
result <- get_image(tissueSampleIds = "GTEX-1117F-0526")
print(result)

# note that `pathologyNotesCategories` (if present) is a list column
print(result$pathologyNotesCategories)

## End(Not run)
```

`get_independent_eqtl`    *Get Independent Eqtl***Description**

Retrieve Independent eQTL Data

- Finds and returns Independent eQTL Data data for the provided list of genes
- By default, this endpoint fetches data from the latest GTEx version

The retrieved data is split into pages with `items_per_page` entries per page

[GTEx portal API documentation](#)

## Usage

```
get_independent_eqtl(
  gencodeIds,
  tissueSiteDetailIds = NULL,
  datasetId = "gtex_v8",
  page = 0,
  itemsPerPage = 250
)
```

## Arguments

gencodeIds	A character vector of Versioned GENCODE IDs, e.g. c("ENSG00000132693.12", "ENSG00000203782.5").
tissueSiteDetailIds	Character vector of IDs for tissues of interest. Can be GTEx specific IDs (e.g. "Whole_Blood"; use <a href="#">get_tissue_site_detail()</a> to see valid values) or Ontology IDs.
datasetId	String. Unique identifier of a dataset. Usually includes a data source and data release. Options: "gtex_v8", "gtex_snrnaseq_pilot".
page	Integer (default = 0).
itemsPerPage	Integer (default = 250).

## Value

A tibble.

```

---

get\_linkage\_disequilibrium\_data  
Get Linkage Disequilibrium Data

---

## Description

Find linkage disequilibrium (LD) data for a given gene.

This endpoint returns linkage disequilibrium data for the cis-eQTLs found associated with the provided gene in a specified dataset. Results are queried by gencode ID. By default, the service queries the latest GTEx release. Specify a dataset ID to fetch results from a different dataset.

[GTEx Portal API documentation](#)

## Usage

```
get_linkage_disequilibrium_data(  
  gencodeId,  
  datasetId = "gtex_v8",  
  page = 0,  
  itemsPerPage = 250  
)
```

## Arguments

gencodeId	String. A Versioned GENCODE ID of a gene, e.g. "ENSG00000065613.9".
datasetId	String. Unique identifier of a dataset. Usually includes a data source and data release. Options: "gtex_v8", "gtex_snrnaseq_pilot".
page	Integer (default = 0).
itemsPerPage	Integer (default = 250).

## Value

A tibble.

## Examples

```
## Not run:  
get_maintenance_message()  
  
## End(Not run)
```

---

`get_median_exon_expression`  
*Get Median Exon Expression*

---

## Description

Find median exon expression data.

- Returns median exon read counts, in tissues, of a collapsed gene model.
- Results may be filtered by dataset, gene or tissue, but at least one gene must be provided

By default, this service queries the latest GTEx release.

[GTEx Portal API documentation](#)

## Usage

```
get_median_exon_expression(  
  gencodeIds,  
  datasetId = "gtex_v8",  
  tissueSiteDetailIds = NULL,  
  page = 0,  
  itemsPerPage = 250  
)
```

## Arguments

gencodeIds	A character vector of Versioned GENCODE IDs, e.g. c("ENSG00000132693.12", "ENSG00000203782.5").
datasetId	String. Unique identifier of a dataset. Usually includes a data source and data release. Options: "gtex_v8", "gtex_snrnaseq_pilot".
tissueSiteDetailIds	Character vector of IDs for tissues of interest. Can be GTEx specific IDs (e.g. "Whole_Blood"; use <code>get_tissue_site_detail()</code> to see valid values) or Ontology IDs.
page	Integer (default = 0).
itemsPerPage	Integer (default = 250).

## Value

A tibble.

## See Also

## Examples

```
## Not run:
# median exon expression values for CRP, filtered for whole blood
get_median_exon_expression(gencodeIds = "ENSG00000132693.12",
                            tissueSiteDetailIds = "Whole_Blood")

## End(Not run)
```

**get\_median\_gene\_expression**  
*Get Median Gene Expression*

## Description

Find median gene expression data along with hierarchical clusters.

- Returns median gene expression in tissues.
- By default, this endpoint queries the latest GTEx release.

[GTEx Portal API documentation](#)

## Usage

```
get_median_gene_expression(
  gencodeIds,
  datasetId = "gtex_v8",
  tissueSiteDetailIds = NULL,
  page = 0,
  itemsPerPage = 250
)
```

## Arguments

gencodeIds	A character vector of Versioned GENCODE IDs, e.g. c("ENSG00000132693.12", "ENSG00000203782.5").
datasetId	String. Unique identifier of a dataset. Usually includes a data source and data release. Options: "gtex_v8", "gtex_srnaseq_pilot".
tissueSiteDetailIds	Character vector of IDs for tissues of interest. Can be GTEx specific IDs (e.g. "Whole_Blood"; use <a href="#">get_tissue_site_detail()</a> to see valid values) or Ontology IDs.
page	Integer (default = 0).
itemsPerPage	Integer (default = 250).

```

**get\_median\_junction\_expression**  
*Get Median Junction Expression*

## Description

Find junction gene expression data.

- Returns median junction read counts in tissues of a given gene from all known transcripts.
- Results may be filtered by dataset or tissue.

By default, this service queries the latest GTEx release.

[GTEx Portal API documentation](#)

## Usage

```
get_median_junction_expression(
  gencodeIds,
  datasetId = "gtex_v8",
  tissueSiteDetailIds = NULL,
  page = 0,
  itemsPerPage = 250
)
```

## Arguments

gencodeIds	A character vector of Versioned GENCODE IDs, e.g. c("ENSG00000132693.12", "ENSG00000203782.5").
datasetId	String. Unique identifier of a dataset. Usually includes a data source and data release. Options: "gtex_v8", "gtex_srnaseq_pilot".
tissueSiteDetailIds	Character vector of IDs for tissues of interest. Can be GTEx specific IDs (e.g. "Whole_Blood"; use <a href="#">get_tissue_site_detail()</a> to see valid values) or Ontology IDs.

`page` Integer (default = 0).

```

`get_median_transcript_expression`  
*Get Median Transcript Expression*

**Description**

Find median transcript expression data of all known transcripts of a gene.

- Returns median normalized expression in tissues of all known transcripts of a given gene.
- Results may be filtered by dataset or tissue.

By default, this service queries the latest GTEx release.

[GTEx Portal API documentation](#)

**Usage**

```
get_median_transcript_expression(
  gencodeIds,
  datasetId = "gtex_v8",
  tissueSiteDetailIds = NULL,
  page = 0,
  itemsPerPage = 250
)
```

## Arguments

gencodeIds	A character vector of Versioned GENCODE IDs, e.g. c("ENSG00000132693.12", "ENSG00000203782.5").
datasetId	String. Unique identifier of a dataset. Usually includes a data source and data release. Options: "gtex_v8", "gtex_srnaseq_pilot".
tissueSiteDetailIds	Character vector of IDs for tissues of interest. Can be GTEx specific IDs (e.g. "Whole_Blood"; use <a href="#">get_tissue_site_detail()</a> to see valid values) or Ontology IDs.

## End(Not run)
```

**get\_multi\_tissue\_eqtls**  
*Get Multi Tissue Eqtls*

## Description

Find multi-tissue eQTL Metasoft results.

- This service returns multi-tissue eQTL Metasoft results for a given gene and variant in a specified dataset.
- A Versioned GENCODE ID must be provided.
- For each tissue, the results include: m-value (mValue), normalized effect size (nes), p-value (pValue), and standard error (se).
- The m-value is the posterior probability that an eQTL effect exists in each tissue tested in the cross-tissue meta-analysis (Han and Eskin, PLoS Genetics 8(3): e1002555, 2012).

- The normalized effect size is the slope of the linear regression of normalized expression data versus the three genotype categories using single-tissue eQTL analysis, representing eQTL effect size.
- The p-value is from a t-test that compares observed NES from single-tissue eQTL analysis to a null NES of 0.

By default, the service queries the latest GTEx release. The retrieved data is split into pages with `items_per_page` entries per page

[GTEx Portal API documentation](#)

## Usage

```
get_multi_tissue_eqtls(
  gencodeIds,
  variantId = NULL,
  datasetId = "gtex_v8",
  page = 0,
  itemsPerPage = 250
)
```

## Arguments

<code>gencodeIds</code>	A character vector of Versioned GENCODE IDs, e.g. <code>c("ENSG00000132693.12", "ENSG00000203782.5")</code> .
<code>variantId</code>	String. A gtex variant ID.
<code>datasetId</code>	String. Unique identifier of a dataset. Usually includes a data source and data release. Options: "gtex_v8", "gtex_snrnaseq_pilot".
<code>page</code>	Integer (default = 0).
<code>itemsPerPage</code>	Integer (default = 250).

## Value

A tibble.

  ageBrackets = NULL,
  hardyScales = NULL,
  hasExpressionData = NULL,
  hasGenotype = NULL,
  page = 0,
  itemsPerPage = 250
)
```

## Arguments

<code>draw</code>	Integer.
<code>materialTypes</code>	String, vector. Options: "Cells:Cell Line Viable", "DNA:DNA Genomic", "DNA:DNA Somatic", "RNA:Total RNA", "Tissue:PAXgene Preserved", "Tissue:PAXgene Preserved Paraffin-embedded", "Tissue:Fresh Frozen Tissue".
<code>tissueSiteDetailIds</code>	Character vector of IDs for tissues of interest. Can be GTEx specific IDs (e.g. "Whole_Blood"; use <code>get_tissue_site_detail()</code> to see valid values) or Ontology IDs.
<code>pathCategory</code>	Character vector. Options: "adenoma", "amylacea", "atelectasis", "atherosclerosis", "atherosis", "atrophy", "calcification", "cirrhosis", "clean_specimens", "congestion", "corpora_albicania", "cyst", "desquamation", "diabetic", "dysplasia", "edema", "emphysema", "esophagitis", "fibrosis", "gastritis", "glomerulosclerosis", "goiter", "gynecomastoid", "hashimoto", "heart_failure_cells", "hemorrhage", "hepatitis", "hyalinization", "hypereosinophilia", "hyperplasia", "hypertrophy", "hypoxic", "infarction", "inflammation", "ischemic_changes", "macrophages", "mastopathy", "metaplasia", "monckeberg", "necrosis", "nephritis", "nephrosclerosis", "no_abnormalities", "nodularity", "pancreatitis", "pigment", "pneumonia", "post_menopausal", "prostatitis", "saponification", "scarring", "sclerotic", "solar_elastosis", "spermatogenesis", "steatosis", "sweat_glands", "tma".
<code>tissueSampleIds</code>	Array of strings. A list of Tissue Sample ID(s).
<code>sex</code>	String. Options: "male", "female".
<code>sortBy</code>	String. Options: "sampleId", "ischemicTime", "aliquotId", "tissueSampleId", "hardyScale", "pathologyNotes", "ageBracket", "tissueSiteDetailId", "sex".

<code>sortDirection</code>	String. Options: "asc", "desc". Default = "asc".
<code>searchTerm</code>	String.
<code>sampleIds</code>	Character vector. GTEx sample ID.
<code>subjectIds</code>	Character vector. GTEx subject ID.
<code>ageBrackets</code>	The age bracket(s) of the donors of interest. Options: "20-29", "30-39", "40-49", "50-59", "60-69", "70-79".
<code>hardyScales</code>	Character vector. A list of Hardy Scale(s) of interest. Options: "Ventilator case", "Fast death - violent", "Fast death - natural causes", "Intermediate death", "Slow death".
<code>hasExpressionData</code>	Logical.
<code>hasGenotype</code>	Logical.
<code>page</code>	Integer (default = 0).
<code>itemsPerPage</code>	Integer (default = 250).

  sortDirection = NULL,
  page = NULL,
  itemsPerPage = NULL
)
```

**Arguments**

datasetId	String. Unique identifier of a dataset. Usually includes a data source and data release. Options: "gtex_v8", "gtex_snrnaseq_pilot".
sampleIds	Character vector. GTEx sample ID.
tissueSampleIds	Array of strings. A list of Tissue Sample ID(s).
subjectIds	Character vector. GTEx subject ID.
ageBrackets	The age bracket(s) of the donors of interest. Options: "20-29", "30-39", "40-49", "50-59", "60-69", "70-79".
sex	String. Options: "male", "female".
pathCategory	Character vector. Options: "adenoma", "amylacea", "atelectasis", "atherosclerosis", "atherosis", "atrophy", "calcification", "cirrhosis", "clean_specimens", "congestion", "corpora_albicania", "cyst", "desquamation", "diabetic", "dysplasia", "edema", "emphysema", "esophagitis", "fibrosis", "gastritis", "glomerulosclerosis", "goiter", "gynecomastoid", "hashimoto", "heart_failure_cells", "hemorrhage", "hepatitis", "hyalinization", "hypereosinophilia", "hyperplasia", "hypertrophy", "hypoxic", "infarction", "inflammation", "ischemic_changes", "macrophages", "mastopathy", "metaplasia", "monckeberg", "necrosis", "nephritis", "nephrosclerosis", "no_abnormalities", "nodularity", "pancreatitis", "pigment", "pneumonia", "post_menopausal", "prostatitis", "saponification", "scarring", "sclerotic", "solar_elastosis", "spermatogenesis", "steatosis", "sweat_glands", "tma".

<code>tissueSiteDetailId</code>	String. The ID of the tissue of interest. Can be a GTEx specific ID (e.g. "Whole_Blood"; use <a href="#">get_tissue_site_detail()</a> to see valid values) or an Ontology ID.
<code>aliquotIds</code>	Character vector.
<code>autolysisScores</code>	Character vector. Options: "None", "Mild", "Moderate", "Severe".
<code>hardyScales</code>	Character vector. A list of Hardy Scale(s) of interest. Options: "Ventilator case", "Fast death - violent", "Fast death - natural causes", "Intermediate death", "Slow death".
<code>ischemicTime</code>	Integer.
<code>ischemicTimeGroups</code>	Character vector. Options: "<= 0", "1 - 300", "301 - 600", "601 - 900", "901 - 1200", "1201 - 1500", "> 1500".
<code>rin</code>	Integer vector.
<code>uberonIds</code>	Character vector of Uberon IDs (e.g. "UBERON:EFO_0000572"; use <a href="#">get_tissue_site_detail()</a> to see valid values).
<code>dataTypes</code>	Character vector. Options: "RNASEQ", "WGS", "WES", "OMNI", "EXCLUDE".
<code>sortBy</code>	String. Options: "sampleId", "ischemicTime", "aliquotId", "tissueSampleId", "hardyScale", "pathologyNotes", "ageBracket", "tissueSiteDetailId", "sex".
<code>sortDirection</code>	String. Options: "asc", "desc". Default = "asc".
<code>page</code>	Integer (default = 0).
<code>itemsPerPage</code>	Integer (default = 250).

## Value

A tibble

## See Also

## Examples

```
## Not run:
get_sample_datasets_endpoints()

## End(Not run)
```

---

get_service_info	<i>Get Service Info</i>
------------------	-------------------------

---

## Description

General information about the GTEx service.

[GTEx Portal API documentation.](#)

## Usage

```
get_service_info()
```

## Value

A tibble.

## Examples

```
## Not run:  
get_service_info()  
  
## End(Not run)
```

---

get_significant_single_tissue_eqtls	<i>Get Significant Single Tissue Eqtls</i>
-------------------------------------	--------------------------------------------

---

## Description

Find significant single tissue eQTLs.

- This service returns precomputed significant single tissue eQTLs.
- Results may be filtered by tissue, gene, variant or dataset.
- To search by gene, use the versioned GENCODE ID.
- To search by variant, use the dbSNP rs ID (snpId).

By default, the service queries the latest GTEx release and the retrieved data is split into pages with items\_per\_page entries per page

[GTEx Portal API documentation.](#)

**Usage**

```
get_significant_single_tissue_eqtls(
  gencodeIds = NULL,
  variantIds = NULL,
  tissueSiteDetailIds = NULL,
  datasetId = "gtex_v8",
  page = 0,
  itemsPerPage = 250
)
```

**Arguments**

<code>gencodeIds</code>	A character vector of Versioned GENCODE IDs, e.g. c("ENSG00000132693.12", "ENSG00000203782.5").
<code>variantIds</code>	Character vector. Gtex variant IDs.
<code>tissueSiteDetailIds</code>	Character vector of IDs for tissues of interest. Can be GTEx specific IDs (e.g. "Whole_Blood"; use <a href="#">get_tissue_site_detail()</a> to see valid values) or Ontology IDs.
<code>datasetId</code>	String. Unique identifier of a dataset. Usually includes a data source and data release. Options: "gtex_v8", "gtex_snrnaseq_pilot".
<code>page</code>	Integer (default = 0).
<code>itemsPerPage</code>	Integer (default = 250).

**Details**

**Note:** although the GTEx Portal API documentation says to use the dbSNP rsID when searching by variant, this returns no results. Instead use gtex variant IDs e.g. use "chr1\_153209640\_C\_A\_b38" instead of "rs1410858".

**Value**

A tibble.

**See Also**

Other Static Association Endpoints: [get\\_eqtl\\_genes\(\)](#), [get\\_fine\\_mapping\(\)](#), [get\\_independent\\_eqtl\(\)](#), [get\\_multi\\_tissue\\_eqtls\(\)](#), [get\\_significant\\_single\\_tissue\\_eqtls\\_by\\_location\(\)](#), [get\\_significant\\_single\\_tissue\\_isqlts\(\)](#), [get\\_significant\\_single\\_tissue\\_sqtls\(\)](#), [get\\_sqtl\\_genes\(\)](#)

                                    tissueSiteDetailIds = "Whole_Blood")

## End(Not run)
```

**get\_significant\_single\_tissue\_eqtls\_by\_location**  
*Get Significant Single Tissue eQTLs By Location*

## Description

Find significant single tissue eQTLs using Chromosomal Locations.

- This service returns precomputed significant single tissue eQTLs.
- Results may be filtered by tissue, and/or dataset.

By default, the service queries the latest GTEx release. Since this endpoint is used to support a third party program on the portal, the return structure is different from other endpoints and is not paginated.

[GTEx Portal API documentation](#)

## Usage

```
get_significant_single_tissue_eqtls_by_location(
  tissueSiteDetailId,
  start,
  end,
  chromosome,
  datasetId = "gtex_v8"
)
```

## Arguments

tissueSiteDetailId	String. The ID of the tissue of interest. Can be a GTEx specific ID (e.g. "Whole_Blood"; use <a href="#">get_tissue_site_detail()</a> to see valid values) or an Ontology ID.
start	Integer.
end	Integer.
chromosome	String. One of "chr1", "chr2", "chr3", "chr4", "chr5", "chr6", "chr7", "chr8", "chr9", "chr10", "chr11", "chr12", "chr13", "chr14", "chr15", "chr16", "chr17", "chr18", "chr19", "chr20", "chr21", "chr22", "chrM", "chrX", "chrY".

`datasetId` String. Unique identifier of a dataset. Usually includes a data source and data release. Options: "gtex\_v8", "gtex\_snrnaseq\_pilot".

### Value

A tibble.

### See Also

  start = 10000,
  end = 250000,
  chromosome = "chr11")

## End(Not run)
```

`get_significant_single_tissue_ieqtls`  
*Get Significant Single Tissue Ieqtls*

### Description

Retrieve Interaction eQTL Data.

- This service returns cell type interaction eQTLs (ieQTLs), from a specified dataset.
- Results may be filtered by tissue
- By default, the service queries the latest GTEx release.

The retrieved data is split into pages with `items_per_page` entries per page

[GTEx Portal API documentation](#)

### Usage

```
get_significant_single_tissue_ieqtls(
  gencodeIds,
  variantIds = NULL,
  tissueSiteDetailIds = NULL,
  datasetId = "gtex_v8",
  page = 0,
  itemsPerPage = 250
)
```

## Arguments

gencodeIds	A character vector of Versioned GENCODE IDs, e.g. c("ENSG00000132693.12", "ENSG00000203782.5").
variantIds	Character vector. Gtex variant IDs.
tissueSiteDetailIds	Character vector of IDs for tissues of interest. Can be GTEx specific IDs (e.g. "Whole_Blood"; use <a href="#">get_tissue_site_detail()</a> to see valid values) or Ontology IDs.
datasetId	String. Unique identifier of a dataset. Usually includes a data source and data release. Options: "gtex_v8", "gtex_snrnaseq_pilot".
page	Integer (default = 0).
itemsPerPage	Integer (default = 250).

## Value

## End(Not run)
```

**get\_significant\_single\_tissue\_isqtls**  
*et Significant Single Tissue Isqtl*

## Description

Retrieve Interaction sQL Data.

- This service retrieves cell type interaction sQTLs (isQTLs), from a specified dataset.
- Results may be filtered by tissue
- By default, the service queries the latest GTEx release.

The retrieved data is split into pages with items\_per\_page entries per page

[GTEx Portal API documentation](#).

**Usage**

```
get_significant_single_tissue_isqtls(
  gencodeIds,
  variantIds = NULL,
  tissueSiteDetailIds = NULL,
  datasetId = "gtex_v8",
  page = 0,
  itemsPerPage = 250
)
```

**Arguments**

<code>gencodeIds</code>	A character vector of Versioned GENCODE IDs, e.g. <code>c("ENSG00000132693.12", "ENSG00000203782.5")</code> .
<code>variantIds</code>	Character vector. Gtex variant IDs.
<code>tissueSiteDetailIds</code>	Character vector of IDs for tissues of interest. Can be GTEx specific IDs (e.g. "Whole_Blood"; use <code>get_tissue_site_detail()</code> to see valid values) or Ontology IDs.
<code>datasetId</code>	String. Unique identifier of a dataset. Usually includes a data source and data release. Options: "gtex_v8", "gtex_snrnaseq_pilot".
<code>page</code>	Integer (default = 0).
<code>itemsPerPage</code>	Integer (default = 250).

## get\_top\_expressed\_genes

*Get Top Expressed Genes*

### Description

Find top expressed genes for a specified tissue.

- Returns top expressed genes for a specified tissue in a dataset, sorted by median expression.
- When the optional parameter filterMtGene is set to true, mitochondrial genes will be excluded from the results. By default, this service queries the latest GTEx release.

[GTEx Portal API documentation](#)

### Usage

```
get_top_expressed_genes(
  tissueSiteDetailId,
  datasetId = "gtex_v8",
  filterMtGene = TRUE,
  page = 0,
  itemsPerPage = 250
)
```

### Arguments

tissueSiteDetailId	String. The ID of the tissue of interest. Can be a GTEx specific ID (e.g. "Whole_Blood"; use <a href="#">get_tissue_site_detail()</a> to see valid values) or an Ontology ID.
datasetId	String. Unique identifier of a dataset. Usually includes a data source and data release. Options: "gtex_v8", "gtex_snrnaseq_pilot".
filterMtGene	Logical. Exclude mitochondrial genes.
page	Integer (default = 0).
itemsPerPage	Integer (default = 250).

### Value

A tibble.

## Examples

```
## Not run:  
get_top_expressed_genes(tissueSiteDetailId = "Artery_Aorta")  
  
## End(Not run)
```

---

get\_transcripts      *Get Transcripts*

---

## Description

Find all transcripts of a reference gene.

- This service returns information about transcripts of the given versioned GENCODE ID.
- A genome build and GENCODE version must be provided.
- By default, this service queries the genome build and GENCODE version used by the latest GTEx release.

[GTEx API Portal documentation](#)

## Usage

```
get_transcripts(  
  gencodeId,  
  gencodeVersion = "v26",  
  genomeBuild = "GRCh38/hg38",  
  page = 0,  
  itemsPerPage = 250  
)
```

## Arguments

gencodeId      String. A Versioned GENCODE ID of a gene, e.g. "ENSG00000065613.9".  
gencodeVersion      String (default = "v26"). GENCODE annotation release. Either "v26" or "v19".  
genomeBuild      String. Options: "GRCh38/hg38", "GRCh37/hg19". Default = "GRCh38/hg38".  
page      Integer (default = 0).  
itemsPerPage      Integer (default = 250).

**Value**

A tibble.

**Examples**

```
## Not run:
get_transcripts(gencodeId = "ENSG00000203782.5")

## End(Not run)
```

---

**get\_variant**

*Get Variant*

---

**Description**

This service returns information about a variant, including position, dbSNP RS ID, the reference allele, the alternative allele, and whether the minor allele frequency is  $\geq 1\%$ . For GTEx v6p, there is also information about whether the whole exome sequence and chip sequencing data are available. Results may be queried by GTEx variant ID (variantId), dbSNP RS ID (snpId) or genomic location (chromosome and pos). Variants are identified based on the genotype data of each dataset cohort, namely, are dataset-dependent. Each variant is assigned a unique GTEx variant ID (i.e. the primary key). Not all variants have a mappable dbSNP RS ID. By default, this service queries the latest GTEx release.

[GTEx Portal API documentation](#)

**Usage**

```
get_variant(
  snpId = NULL,
  variantId = NULL,
  chromosome = NULL,
  pos = NULL,
  datasetId = "gtex_v8",
  page = 0,
  itemsPerPage = 250
)
```

## Arguments

snpId	String
variantId	String. A gtex variant ID.
chromosome	String. One of "chr1", "chr2", "chr3", "chr4", "chr5", "chr6", "chr7", "chr8", "chr9", "chr10", "chr11", "chr12", "chr13", "chr14", "chr15", "chr16", "chr17", "chr18", "chr19", "chr20", "chr21", "chr22", "chrM", "chrX", "chrY".
pos	Integer, vector.
datasetId	String. Unique identifier of a dataset. Usually includes a data source and data release. Options: "gtex_v8", "gtex_snrnaseq_pilot".
page	Integer (default = 0).
itemsPerPage	Integer (default = 250).

## Value

A tibble.

## See Also

## Examples

```
# search by rsid
get_variant(snpId = "rs1410858")

# search by variantId
get_variant(variantId = "chr1_153209640_C_A_b38")

# search by chromosome and position
get_variant(chromosome = "chr1",
           pos = 153209600:153209700)
```

## get\_variant\_by\_location

*Get Variant By Location*

## Description

This service allows the user to query information about variants on a certain chromosome at a certain location.

[GTEx Portal API documentation](#)

**Usage**

```
get_variant_by_location(
  start,
  end,
  chromosome,
  sortBy = "pos",
  sortDirection = "asc",
  page = 0,
  itemsPerPage = 250
)
```

**Arguments**

<code>start</code>	<code>Integer.</code>
<code>end</code>	<code>Integer.</code>
<code>chromosome</code>	<code>String.</code> One of "chr1", "chr2", "chr3", "chr4", "chr5", "chr6", "chr7", "chr8", "chr9", "chr10", "chr11", "chr12", "chr13", "chr14", "chr15", "chr16", "chr17", "chr18", "chr19", "chr20", "chr21", "chr22", "chrM", "chrX", "chrY".
<code>sortBy</code>	<code>String.</code> Options: "sampleId", "ischemicTime", "aliquotId", "tissueSampleId", "hardyScale", "pathologyNotes", "ageBracket", "tissueSiteDetailId", "sex".
<code>sortDirection</code>	<code>String.</code> Options: "asc", "desc". Default = "asc".
<code>page</code>	<code>Integer</code> (default = 0).
<code>itemsPerPage</code>	<code>Integer</code> (default = 250).

**Value**

A tibble.
